Hello everyone,

We quite often see cases related to SQS communication. We have some steps to test the communication, but it is all manual work. I've came up with this solution that might be easier since it automates almost the entire process.

Steps:
Launch a new ec2 instance, Amazon Linux 2023 (same as worker) in the same subnet where the workers are getting deployed and using the same security group and the same instance profile.

By default, the Amazon Linux 2023 has python3 installed:

```
[   ,     #_
    ~\_  ####_        Amazon Linux 2023
   ~~  \_#####\
   ~~     \###|
   ~~       \#/ ___   https://aws.amazon.com/linux/amazon-linux-2023
    ~~       V~' '->
     ~~~         /
       ~~._.   _/
          _/ _/
        _/m/'

[ec2-user@ip-10-10-80-250 ~]$ ls
sqstest.py
[ec2-user@ip-10-10-80-250 ~]$
```

Install Python tools:
sudo yum install -u python3-pip python3-setuptools

Install boto3
pip install boto3

Execute the script as follows:

python3 sqstest.py

Paste the Backup Role ARN

```
[ec2-user@ip-10-10-80-250 ~]$ python3 sqstest.py
Paste Your Backup Role Arn:
```

```
[ec2-user@ip-10-10-80-250 ~]$ python3 sqstest.py
Paste Your Backup Role Arn: arn:aws:iam::[redacted]357:role/veeam/path/barella-cross-path
Assuming role...
Starting session...
Let's test the SQS communication, first we will create a SQS queue
Type any queue name to be created:
```

Pick a name for the temporary SQS queue, it will create a new queue and send a message to that queue:

```
[ec2-user@ip-10-10-80-250 ~]$ python3 sqstest.py
Paste Your Backup Role Arn: arn:aws:iam::202854644357:role/veeam/path/barella-cross-path
Assuming role...
Starting session...
Let's test the SQS communication, first we will create a SQS queue
Type any queue name to be created: testing_queue
Enter region name (example: us-east-1): us-west-2
This is your new queue URL: https://sqs.us-west-2.amazonaws.com/202854644357/testing_queue
Your message has been sent, Message ID: 293d85a6-34ae-4012-8b84-56695278d8ab
Do you want to remove the resources created for this test? (Y/N)
```

Then you type Y if you want to remove the queue created and revoke credentials, if for some reason you want to keep the queue for troubleshooting type N.

```
[ec2-user@ip-10-10-80-250 ~]$ python3 sqstest.py
Paste Your Backup Role Arn: arn:aws:iam::202854644357:role/veeam/path/barella-cross-path
Assuming role...
Starting session...
